WOODEN MINI SHED FOR GARDEN INVENTORY AND HOUSEHOLD

mounting instruction

Tools you will need:

TORX

Cross head Screwdrivers

1. Open the packaging

2. Set the floor base

3. Building the walls

Fix the walls to the base step by step. It is advised to do this step for two people together as one can hold and the other screw. Determine screwing points yourself. Each panel needs 2 screws (50mm long) for fixing it to the floor base. **Walls need to be screwed on top of the floor base!** Start by mounting the front wall.

Fasten the walls together by screwing. Screwing places are not marked but are optional. Each wall needs to be fastened together with another wall by using 3 screws (50mm long). In total 12 screws for all four walls.

4. Mounting the roof

The roof consists of two plates, which need to be fastened together.

Boards need to be screwed from the back side by using six 25mm screws. During the screwing process the plates need to be placed on a firm ground and pressed tightly together so there is not a gap between them.

Both roof plates need to be carefully placed on the intended place for them. It is advised to do this step for two people together. Roof plates need to be screwed by 35mm screws.

Screw the door clasp in the height you wish and the mini shed is ready!

The kit includes only roof base made out of 2 plywood plates. It is intended that the roofing is optional according to the customer's wishes. **The roofing needs to be obtained separately.**

Advice!

For painting you can use any lacquer or coating paint, which is intended for outdoor use. The shed is made out of material that is not proceeded to be very smooth but serves better for outdoor use and longer than smoothly proceeded material.
